

## HD2302.0 PHOTO-RADIOMETER

The **HD2302.0** is a portable instrument with a large LCD display. It measures **illuminance**, **luminance**, **PAR** and **irradiance** (across VIS-NIR, UVA, UVB and UVC spectral regions or measurement of irradiance effective according to the UV action curve). The probes are equipped with the SICRAM automatic detection module: in addition to detection, the unit of measurement selection is also automatic. The factory calibration data are already memorized inside the instruments. The *Max*, *Min* and *Avg* function calculate the maximum, minimum or average values. Other functions include: the relative measurement REL, the HOLD function, and the automatic turning off that can also be excluded. **The instruments have IP67 protection degree.**

TOTAL EFFECTIVE IRRADIANCE probe LP 471 ERY

The probe LP 471 ERY measures the total effective irradiance (W<sub>eff</sub>/m<sup>2</sup>) according to the UV action curve (CEI EN 60335-2-27). A particular type of photodiode and a combination of special filters bring the spectral response closer to the UV action curve.

CEI EN 60335-2-27 standards establish a maximum allowable dose of 100J/m<sup>2</sup> for first-time exposure and an annual dose of 15000J/m<sup>2</sup>.

The typical spectral response curve of LP 471 ERY is shown in the Figure together with the UV action curve.

The good accordance between the two curves enables the instrument to take reliable measurements of different types of lamps (and filters) used at present for tanning machines.

**Calibration is performed at 290nm using a SIT calibrated photodiode as reference.**
